

## Laughing Stock Scrum Meeting 5

2026-03-24

Aiden was 20 minutes late without notifying the group, Tom to be joining online, did not make any efforts to join.

Notifications need to be added to users, all user types will receive notifications:

Customers get notifications for:

Order created, order deleted, item removed, item added, order status changed.

Drivers get notifications for:

Deliveries made available (new order is placed and is unassigned).

→ Unable to be seen as for our given workflow as orders cannot be created while the driver is logged in.

Restaurant manager gets notification for:

When an order is placed at the restaurant (if the restaurant does not have the manager, notification is omitted).

→ Unable to be seen as for our given workflow as orders cannot be created while the manager is logged in.

We must implement some time-based tracking.

We need to implement manager and driver logic.

Aiden will be working on the manager branch, and go through and ensure we have all the right types of testing.

Ben will implement the driver branch and some tracking status, to ensure orders can progress from 'accepted' (by a driver) to 'delivered'.

Daniel will implement the notifications.

Tom was absent and does not have any expectations.

All code must be completed by tomorrow, before our meeting.
